Experience

SpaceX Jul 2024 – Present

Software Engineer II | Production and Launch Operations *Cape Canaveral, FL | Jun 2026 – Present*

- Leading design of a new Starship refurb/maintenance scheduling system as the forward-deployed engineer embedded with launch ops; building constraint logic that ties forward-schedule forecasts to hardware targets.
- Built an end-to-end AI SDLC on the internal Grok-native platform as an agent runner with ephemeral pods (Kubernetes + Kata VMs) and human-in-the-loop spec review, significantly accelerating ticket-to-PR cycle time.
- Rolled the scheduling platform out to Hawthorne subassembly shops, unifying both Starship production sites on the same in-house stack.

Software Engineer II | Starship Production *Starbase, TX | Aug 2025 – May 2026*

- Scaled the labor-loaded production scheduling platform from **1→N** across sites to **10,000+ weekly sessions** and fully rolled it out across the entire Starbase Starship production floor (subassemblies and steel barrels through final integration); embedded with operators to ship the features they used daily.
- Built a constraint system that models physics and labor constraints, plus an execution tracker that consolidates multi-app data into a single floor-facing dashboard.
- Led migration off legacy platforms by building the views and data connections required for feature parity (enabling full cutover and decommission); built an MCP server over platform data for reporting and agent access.
- Deployed the scheduler to the new pad build; the execution tracker gave operators real-time progress-against-plan metrics so they could identify and recover slips faster.
- Added RBAC for time estimates and clock-ins and tightened the labor-loading model, bringing hours executed vs. estimated **30%** closer to target.

Software Engineer I | Starship Production *Starbase, TX | Jul 2024 – Aug 2025*

- Built the labor-loaded production scheduler from **0→1** (Angular, C# .NET, PostgreSQL, ClickHouse); replaced Smartsheet, set program-wide date targets, and reduced scheduling cycles from weeks to days.
- Forward-deployed with operators: defined constraints on the floor, prototyped, and shipped directly; redesigned ERP time-estimate tooling and clock-in KPIs, lifting efficiency **25%**.
- Used the forward-scheduled forecast as the feedback loop for MRP allocations, significantly improving date accuracy; accelerated the underlying queries with ClickHouse.
- Implemented a canvas-native scheduling renderer and real-time production tracker (used on floor displays and handhelds) so technicians could execute to schedule in real time.
- Owned deployment and on-call for multiple production services (Docker, Kubernetes, Helm, Terraform) at **99.9%** uptime; resolved ERP outages affecting **6,000+ users**.

Projects

Colorify | *React, TailwindCSS, Chrome Extension API* github.com/yamakov03/colorify

- Open-source Chrome extension that injects and restyles CSS on any site, with cross-device sync.

Just The News | *Python, Flask, NLTK, Bootstrap* justthenews-flask-app.onrender.com

- Mobile-first web app that scrapes trending news and generates NLP summaries in real time.

Education

Georgia Institute of Technology Aug 2024 – Present
Master of Science in Computer Science *Remote*

University of Texas at Austin Aug 2021 – May 2024
Bachelor of Science in Electrical and Computer Engineering (GPA: 3.72/4.00) *Austin, TX*

Technical Skills

Languages: C#, TypeScript, JavaScript, Python, SQL, Java, C++, HTML/CSS
Frameworks & Frontend: .NET, Angular, React, RxJS, Next.js, HTML Canvas, WebSocket
Data & Infra: PostgreSQL, ClickHouse, Kafka, Docker, Kubernetes, Helm, Terraform, CI/CD
Observability: Grafana, Prometheus, Loki
AI & Agents: MCP (Model Context Protocol), LLM agents, spec-driven AI SDLC, production agent workflows
